

**Adapter for tool presetting**

## High-precision tool setting during production

Quick and precise tool change is achieved by accurately presetting your tools outside the machine, combined with a highly accurate fixation system.

Whether W serration, V-gib, TRAUB gib, MS-grooving slide or the robust compact shank 45 tooling system — custom-tailored INDEX presetting adapters allow you to measure your tools with high precision outside the machine.

Presetting of tools during production reduces the downtime of your machine associated with the setup process. Time-consuming alignment and run-in of tools in the machine are not required.

Our presetting adapters are available from stock with stub taper 50 or VDI 80 interface to match your tool presetting unit.

After presetting is complete, the patented fixing systems ensure reliable and highly accurate transmission of the presetting dimensions to the machine. Dimensionally accurate workpieces are produced directly after the setup process.
